

FinHealth

MSME Financial Health Card — Product Requirements Document

IDBI Innovate 2026 · Track 03 · July 2026

1. Executive Summary

FinHealth is an AI-powered MSME Financial Health Card platform designed for IDBI Innovate 2026 Track 03. It addresses the \$530 billion MSME credit gap in India by enabling credit-invisible businesses to access formal financing through alternate data-driven assessment. The product aggregates GST, UPI, Account Aggregator (AA), and EPFO data via a multi-agent orchestration engine, producing an explainable, multidimensional health score that IDBI credit officers can trust and act upon.

Unlike generic credit scoring tools, FinHealth is built specifically for the Indian banking ecosystem — integrating with ULI, OCEN, and AA frameworks, complying with RBI's explainable AI mandate, and designed for both MSME self-service and bank officer decision support. The platform is positioned as an IDBI-first solution with clear pathway to independent B2B SaaS deployment across NBFCs and other banks.

1.1 Winning Proposition

- **Agentic Architecture:** Four specialized data agents (GST, UPI, AA, EPFO) feeding a central scoring orchestrator — modular, auditable, and extensible.
- **Explainability by Design:** Every score is decomposable into feature contributions with SHAP-style weights, satisfying RBI regulatory requirements.
- **Dual-Sided Platform:** Both MSME onboarding journey and officer underwriting console are fully functional, demonstrating real-world usability.
- **Post-Loan Monitoring:** Continuous score tracking with early warning signals, showing lifecycle value beyond origination.
- **Production-Ready Stack:** Next.js 14, TypeScript, Supabase, FastAPI, and Tailwind CSS — deployable to Vercel within hours.

2. Problem Statement Alignment

IDBI Innovate 2026 Track 03 requires: 'An AI/ML-driven MSME Financial Health Card using alternate data (GST, UPI, AA, EPFO) for credit-invisible enterprises, producing a multidimensional score that visualizes strengths and risks, integrates with ULI/OCEN/AA ecosystems, and enables near real-time assessment.'

IDBI Requirement	FinHealth Implementation	Evidence in Demo
Aggregates GST, UPI, AA, EPFO	Four independent agent services with dedicated data agents	Live agent sync with progress bars
Multidimensional health score	Composite 300-900 score with 4 dimension sub-scores	Radar chart + dimension bars
Visualizes strengths & risks	Color-coded signal tags + risk band badges	Green/amber/red signal chips
ULI/OCEN/AA integration	API-first design with OCEN-compatible loan origination	Loan application flow with OCEN-style payload
Near real-time assessment	Parallel agent execution with <4min end-to-end	Simulated 4-agent parallel sync
Expands credit-invisible onboarding	Alternate-data scoring lifts eligible MSMEs from ~10% to ~40%	Demo of 100s with thin-file approval

3. User Personas & Stories

3.1 Persona: MSME Business Owner

Ramesh, 42, runs a 12-employee manufacturing unit in Coimbatore. He has no CIBIL score because he never took a formal loan. He needs ₹15 lakh working capital to fulfill a new export order. Traditional banks reject him due to 'thin credit file.' He has 5 years of GST filings, regular UPI merchant payments, and 12 employees on EPFO.

- As an MSME owner, I want to check my Financial Health Score so that I understand my creditworthiness before applying.
- As an MSME owner, I want to grant granular consent per data source so that I retain control over my financial data.
- As an MSME owner, I want to see why my score is what it is so that I can take specific actions to improve it.
- As an MSME owner, I want to apply for a loan with pre-filled eligibility so that I don't waste time on rejected applications.

3.2 Persona: IDBI Credit Officer

Priya, 35, is a Deputy Manager at IDBI's SME Lending Branch in Chennai. She processes 40+ MSME applications monthly. She needs defensible, explainable decisions that withstand audit and RBI scrutiny. She distrusts black-box AI scores.

- As a credit officer, I want to see all pending applications in a queue so that I can prioritize high-potential MSMEs.
- As a credit officer, I want full explainability of every score so that I can defend my decision to senior management.
- As a credit officer, I want to see 6-month score trends so that I can identify deteriorating businesses before disbursement.
- As a credit officer, I want to approve/reject with a single click and audit trail so that my decisions are traceable.
- As a credit officer, I want post-disbursement monitoring so that I can catch early warning signals before they become NPAs.

4. Feature Specifications

4.1 Feature: MSME Onboarding & Consent

A 5-step wizard guiding the MSME from profile creation to Financial Health Card generation. Each step validates inputs and maintains state. The consent step implements DPDP Act-compliant granular permissions.

Flow:

- Step 1 — Business Profile: GSTIN validation (format check), business name, type, years, location.
- Step 2 — Data Consent: Four toggle switches for GST, UPI, AA, EPFO. Each shows data scope in plain language.
- Step 3 — Data Sync: Parallel agent execution with real-time progress bars per agent. Simulated 4-6 second delay.
- Step 4 — Health Card: Full score display with radar chart, dimension breakdowns, and signal tags.
- Step 5 — Loan Application: Type selector, amount slider, tenure slider, EMI preview, submit.

Wireframe — Step 2 (Consent):

+-----+ FinHealth [Step 2 of 5] +-----+	
Data Consent	
Grant granular consent for each data source.	
[ON] GST Returns	
Filing regularity, revenue trend, tax	
compliance	
[ON] UPI Transactions	
Volume, merchant diversity, cash-flow	
consistency	
[ON] Account Aggregator	
Bank cash flow, EMI discipline, balance	
[ON] EPFO Records	
Employee count, payroll consistency	
[Proceed to Data Sync]	
+-----+	

4.2 Feature: Financial Health Card

The core product artifact — a visual scorecard showing the composite 300-900 score, four dimension sub-scores, a radar chart for multidimensional visualization, and natural-language signal tags explaining strengths and risks.

Score Calculation:

Overall Score = weighted_average(GST_Score × 0.30, UPI_Score × 0.25, AA_Score × 0.25, EPFO_Score × 0.20). Each dimension score is itself a composite of 2-3 sub-metrics. All scores are normalized to 300-900 range to align with bureau conventions (CIBIL uses 300-900).

Grade Mapping:

Score Range	Grade	Risk Band	Loan Eligibility
800-900	A+	Very Low	Immediate approval up to ■50L
750-799	A	Low	Fast-track approval up to ■25L
650-749	B+/B	Low-Medium	Standard review, up to ■15L

550-649	C+/C	Medium-High	Enhanced due diligence, up to ₹8L
300-549	D	High	Reject / collateral required

Wireframe — Health Card:

Financial Health Card			[Low-Medium Risk]	
Sri Lakshmi Engineering Works				
29ABCDE1234F1Z5 · Manufacturing · Chennai				
[RADAR CHART]			718	B+
			/900	
GST Compliance	██████████		720	
UPI Cash Flow	██████████		690	
Bank Health	██████████		710	
Payroll Stability	██████████		750	
Key Signals:				
[Strong GST compliance]			[Regular UPI]	
[Thin bank balance]			[Stable payroll]	

4.3 Feature: Explainability Engine

A SHAP-style feature contribution breakdown showing how each raw data point (GST filing regularity, UPI volume, etc.) contributes positively or negatively to the overall score. Each feature shows: raw value, weight, calculated contribution, and signal direction. This satisfies RBI's explainable AI mandate for credit decisioning.

Explainability Formula:

Contribution_i = (Raw_Value_i / 100) × Weight_i × 900. Positive if Raw_Value_i > threshold, negative otherwise. The sum of all contributions approximates the overall score (with normalization).

4.4 Feature: Credit Officer Console

A premium dashboard for IDBI credit officers showing application queue, portfolio KPIs, score distribution, and individual application deep-dives with full explainability and decision controls.

Console Modules:

- Queue View: Filterable table with application ID, business name, loan type, health score, risk band, status.
- KPI Cards: Total applications, pending review, approved count, portfolio average score.
- Score Distribution: Histogram showing applicant distribution across 5 score buckets.
- Application Detail: Full health card + explainability panel + 6-month trend + decision buttons + audit trail.
- Decision Engine: Approve / Request Review / Reject with one-click confirmation and timestamped audit log.

Wireframe — Queue View:

Credit Officer Console [All Pending App]				
[6] Total	[4] Pending	[2] App	[671] Avg	
App ID	Business	Type	Score	Risk
APP-001	Sri Lakshmi	WC	718	Low-M
APP-002	Ramesh Textile	IF	572	High
APP-003	Bharat Digital	ML	802	Low
APP-004	Annapurna Food	WC	575	High
APP-005	Venkateswara	EP	708	Low-M
APP-006	Green Earth	WC	750	Low

4.5 Feature: Portfolio Monitoring

Post-disbursement tracking module showing active loans, portfolio health trends, watchlist (loans with declining scores), and stress rate calculations. This demonstrates lifecycle value beyond loan origination.

Monitoring Metrics:

- Active Loans: Count of approved and disbursed loans.
- Portfolio Average Score: Weighted average of all active loan holders' current scores.
- Watchlist: Loans where score dropped >10 points in 30 days or fell below 650.
- Stress Rate: $\text{Watchlist count} / \text{Active loans} \times 100$ (target: <5%).
- Score Distribution: Histogram of all active loans across 5 score buckets.

5. Technical Architecture

5.1 Stack Rationale

Layer	Technology	Rationale
Frontend	Next.js 14 + TypeScript + Tailwind CSS	SSR for SEO, App Router for performance, type safety, rapid UI development
State Management	React Context + Zustand	Lightweight, no boilerplate, perfect for demo scope
Backend API	FastAPI (Python)	Async-native, auto-generated OpenAPI docs, ideal for ML scoring endpoints
Database	Supabase (PostgreSQL)	Auth, realtime, row-level security, free tier for demo, instant REST API
AI/ML	Python + scikit-learn + LLM (Groq/Gemini)	Explainable scoring model + LLM for natural language explanations
Charts	Custom SVG + Recharts	Lightweight, no heavy D3 bundle, full control over styling
Deployment	Vercel (frontend) + Railway/Render (backend)	One-click deploy, preview URLs, perfect for hackathon demos
Icons	Lucide React	Consistent, tree-shakeable, no icon font loading issues

5.2 System Architecture Diagram

5.3 API Specification

5.3.1 Authentication

```
POST /api/v1/auth/register
Body: { gstin, name, type, years, location, password }
Response: { user_id, token, profile }

POST /api/v1/auth/login
```

```
Body: { gstin, password }
Response: { token, user_type, profile }
```

```
POST /api/v1/auth/consent
Body: { gst: boolean, upi: boolean, aa: boolean, epfo: boolean }
Response: { consent_id, timestamp, status }
```

5.3.2 Scoring Engine

```
POST /api/v1/score/compute
Body: { profile_id, consent_id }
Response: {
  score_id, overall_score, grade, risk_band,
  dimensions: {
    gst: { score, filing_regularity, revenue_growth, tax_compliance },
    upi: { score, volume, diversity, consistency },
    aa: { score, cash_flow, emi_discipline, balance_maint },
    epfo: { score, employee_count, payroll_consistency }
  },
  signals: [string],
  computed_at: timestamp
}
```

```
GET /api/v1/score/explain/{score_id}
Response: {
  features: [
    { name, raw_value, weight, contribution, impact }
  ],
  recommendations: [string]
}
```

5.3.3 Loan Application

```
POST /api/v1/loans/apply
Body: { profile_id, loan_type, amount, tenure, purpose }
Response: { application_id, status: "pending", estimated_emi, interest_rate }
```

```
GET /api/v1/loans/applications
Query: { status, officer_id, page, limit }
Response: { applications: [], total, page }
```

```
POST /api/v1/loans/{application_id}/decide
Body: { decision: "approve"|"reject"|"review", officer_id, notes }
Response: { application_id, new_status, decided_at }
```

5.3.4 Monitoring

```
GET /api/v1/monitoring/portfolio
Response: {
  active_loans, avg_score, watchlist_count,
  stress_rate, score_distribution: [],
  monthly_trend: [{ month, avg_score }]
}
```

```
GET /api/v1/monitoring/watchlist
Response: { loans: [{ profile_id, name, current_score, change_30d, risk_signal, action }] }
```

5.4 Database Schema

```
-- profiles table
CREATE TABLE profiles (
  id UUID PRIMARY KEY DEFAULT gen_random_uuid(),
  gstin VARCHAR(15) UNIQUE NOT NULL,
  name VARCHAR(255) NOT NULL,
  type VARCHAR(50) NOT NULL,
  years INTEGER,
  location VARCHAR(100),
  status VARCHAR(20) DEFAULT 'pending',
  created_at TIMESTAMP DEFAULT NOW()
```

```

);

-- scores table
CREATE TABLE scores (
  id UUID PRIMARY KEY DEFAULT gen_random_uuid(),
  profile_id UUID REFERENCES profiles(id),
  overall_score INTEGER CHECK (overall_score BETWEEN 300 AND 900),
  grade VARCHAR(3),
  risk_band VARCHAR(20),
  gst_score INTEGER, upi_score INTEGER, aa_score INTEGER, epfo_score INTEGER,
  signals JSONB,
  computed_at TIMESTAMP DEFAULT NOW()
);

-- loans table
CREATE TABLE loans (
  id UUID PRIMARY KEY DEFAULT gen_random_uuid(),
  profile_id UUID REFERENCES profiles(id),
  application_id VARCHAR(20) UNIQUE NOT NULL,
  loan_type VARCHAR(50),
  amount BIGINT,
  tenure INTEGER,
  interest_rate VARCHAR(10),
  status VARCHAR(20) DEFAULT 'pending',
  decided_by UUID,
  decided_at TIMESTAMP,
  created_at TIMESTAMP DEFAULT NOW()
);

-- audits table
CREATE TABLE audits (
  id UUID PRIMARY KEY DEFAULT gen_random_uuid(),
  entity_type VARCHAR(20) NOT NULL,
  entity_id UUID NOT NULL,
  action VARCHAR(50) NOT NULL,
  actor_id UUID,
  details JSONB,
  created_at TIMESTAMP DEFAULT NOW()
);

-- consents table (DPDP compliance)
CREATE TABLE consents (
  id UUID PRIMARY KEY DEFAULT gen_random_uuid(),
  profile_id UUID REFERENCES profiles(id),
  gst_consent BOOLEAN DEFAULT false,
  upi_consent BOOLEAN DEFAULT false,
  aa_consent BOOLEAN DEFAULT false,
  epfo_consent BOOLEAN DEFAULT false,
  consented_at TIMESTAMP,
  revoked_at TIMESTAMP
);

```

6.2 Key Component Specifications

FinancialHealthCard

Props: profile: Profile, compact?: boolean. Renders: overall score (large), grade badge, risk band, radar chart (SVG), four dimension progress bars, signal tags. If compact=true, hides signals and reduces chart size. Uses color tokens: teal-400 for high scores, amber-400 for medium, red-400 for low.

RadarChart

Props: data: Profile, size: number. Pure SVG component with 5 axes (GST, UPI, Cash Flow, Payroll, Growth). Grid lines at 20%, 40%, 60%, 80%, 100%. Polygon fill with teal-500 at 15% opacity. Labels at 12px. No external chart library dependency.

ExplainabilityPanel

Props: profile: Profile. Computes feature contributions using scoring weights. Renders: sorted feature list with contribution bars (green=positive, red=negative), raw values, weights, and recommendations. Includes 'Why this matters' tooltip for non-technical officers.

AgentSyncProgress

Props: agents: Agent[], onComplete: () => void. Renders: 4 progress bars with agent names, status labels, and shimmer animation during sync. Simulates staggered completion (GST first, then UPI, AA, EPFO). Calls onComplete when all agents reach 100%.

6.3 State Management

Zustand stores: (1) authStore — token, userType, profile; (2) onboardingStore — step, profile draft, consents; (3) scoreStore — currentScore, computing status; (4) officerStore — applications, filters, selectedApplication; (5) monitoringStore — portfolioMetrics, watchlist. All stores persist to localStorage for demo continuity.

7. Integration Specifications (Simulated)

7.1 GST Agent

Input: GSTIN, consent token. Output: { filingRegularity (0-100), revenueGrowth (-50 to +100), taxCompliance (0-100), filingHistory: [] }. Simulation: Lookup from mock dataset based on GSTIN prefix. 29xx = Tamil Nadu (higher compliance), 08xx = Rajasthan (moderate). Latency: 800-1200ms simulated.

7.2 UPI Agent

Input: Mobile number (linked to UPI), consent token, date range. Output: { volume (0-100), diversity (0-100), consistency (0-100), topMerchants: [] }. Simulation: Volume based on business type (Manufacturing=high, Services=medium, Trading=variable). Diversity based on years in business (>5 years = higher). Latency: 600-900ms.

7.3 Account Aggregator (AA) Agent

Input: AA handle (mobile@aa), consent token, FIP IDs. Output: { cashFlow (0-100), emiDiscipline (0-100), balanceMaint (0-100), accountSummary: {} }. Simulation: Cash flow from synthetic bank statement patterns. EMI discipline from mock repayment history. Balance maintenance from average monthly balance. Latency: 1000-1500ms.

7.4 EPFO Agent

Input: EPFO establishment ID, consent token. Output: { employeeCount, payrollConsistency (0-100), tenureMonths, contributionHistory: [] }. Simulation: Employee count from business type + years. Payroll consistency from regularity of deposits. Latency: 400-700ms.

7.5 Scoring Orchestrator

Input: Agent outputs, profile metadata. Output: Composite score, grade, risk band, dimension scores, signals. Algorithm: Weighted ensemble with rule-based guardrails. If any dimension < 400, cap overall score at 550. If GST filingRegularity < 50, downgrade one grade. If EPFO payrollConsistency > 90 and employeeCount > 10, boost by 20 points. Explainability: Pre-computed feature weights stored in config. No black-box ML for demo — all rules are inspectable.

7.6 OCEN/ULI Integration Hooks

While real OCEN/ULI APIs are not available in demo, the system designs for them: (1) Loan application payload follows OCEN loan request schema (loanAmount, interestRate, tenure, purpose, borrowerDetails); (2) Score output includes ULI-compatible fields (financialHealthScore, riskBand, recommendedAmount, maxTenure); (3) Consent framework uses AA consent artifact structure (consentHandle, consentId, timestamp, dataRange). These hooks are documented and ready for production integration.

8. Demo Script — Winning Narrative

8.1 Opening (30 seconds)

Start on Landing Page. 'India has 63 million MSMEs. Only 16% have access to formal credit. The rest are credit-invisible — not because they're risky, but because traditional scoring only sees CIBIL. FinHealth changes that.' Click into MSME flow. 'Let me show you how a business owner like Ramesh, a textile trader with no CIBIL score, gets assessed.'

8.2 MSME Onboarding (90 seconds)

Walk through: (1) Profile creation with GSTIN — 'This is the only ID we need.' (2) Granular consent — 'Ramesh controls exactly what data he shares. GST yes, UPI yes, bank statements yes, EPFO yes.' (3) Agent sync — 'Four agents pull data in parallel. GST filings, UPI transactions, bank cash flow, payroll records.' Show progress bars completing. (4) Health Card — '718. Grade B+. Low-Medium risk. Here's why.' Point to radar chart, dimension bars, signal tags. 'Strong GST compliance, regular UPI, but thin bank balance. That's honest, transparent.' (5) Loan application — 'He applies for ₹15 lakh working capital, 18 months. EMI preview. Submit.'

8.3 Officer Console (90 seconds)

Switch to Officer Dashboard. 'Now Priya, the credit officer, sees Ramesh's application in her queue.' Show queue table with 6 applications. 'She filters by pending. Four need review.' Click into APP-001 (Sri Lakshmi). 'Full health card. 718. But she doesn't trust the number alone.' Scroll to Explainability. 'Every feature contribution is visible. GST filing regularity: +45 points. Revenue growth: +36. But balance maintenance: -18. She knows exactly why the score is what it is.' Show 6-month trend. 'Steady improvement. Not a flash in the pan.' Click Approve. 'One click. Full audit trail. Decision logged with timestamp, actor, and reasoning.'

8.4 Monitoring (60 seconds)

Navigate to Monitoring. 'This isn't just about origination. FinHealth monitors every loan post-disbursement.' Show portfolio KPIs: 6 active loans, average score 705, 1 watchlist, stress rate 16.7%. Show score distribution histogram. 'Most loans are healthy. One flagged.' Click watchlist. 'Ramesh Textiles. Score dropped 12 points in 30 days. Declining cash flow. Early warning. Priya can intervene before this becomes an NPA.' Close with: 'From credit-invisible to credit-worthy. From reactive lending to proactive monitoring. That's FinHealth.'

8.5 Closing (30 seconds)

Return to landing. 'FinHealth is built for IDBI today, but designed for every bank and NBFC tomorrow. The agent architecture means new data sources — utility bills, e-commerce ratings, geolocation — plug in without rewriting the engine. The explainability layer means RBI compliance is built-in, not bolted-on. And the dual-sided platform means both the borrower and the lender win.' Show tech stack slide. 'Next.js, FastAPI, Supabase, Vercel. Production-ready. Deployable today.'

9. Build Timeline (2-Day Sprint)

Day	Phase	Tasks	Deliverable
Day 1 AM	Foundation	Setup Next.js + Tailwind + Zustand. Create design system. Build landing page navigation	Landing page navigation working
Day 1 PM	MSME Flow	Build onboarding wizard (5 steps). Profile form, consent toggles, Agent MSME onboarding demo	Agent MSME onboarding demo
Day 1 Eve	Health Card	Build FinancialHealthCard component. Radar chart, dimension bars, signal tags, Mark data component	FinancialHealthCard component
Day 2 AM	Officer Console	Build dashboard layout. KPI grid, application table, filters. Application queue page, detail view	Officer console page
Day 2 PM	Explainability	Build ExplainabilityPanel with feature contributions. Decision button, Full Explainability + decision flow	Full Explainability + decision flow
Day 2 Eve	Monitoring	Build monitoring dashboard. Portfolio metrics, watchlist, score distribution, trend charts, module	Portfolio monitoring module

Day 2 Night	Polish	Animations, responsive fixes, dark mode, error states, empty states, demo-ready UI.	Especially for real.
-------------	--------	---	----------------------

10. Risk Mitigation

Risk	Impact	Mitigation
Mock data feels fake	High	6 diverse profiles with realistic variance. Signals match scores. No perfect scores.
Agent sync too fast/slow	Medium	Staggered delays (400-1500ms). Progress bars with shimmer. Realistic variance.
Explainability too complex	Medium	Pre-computed weights. Simple bar charts. Plain language recommendations.
Demo crashes during judging	High	Static HTML fallback. All data in localStorage. No external API dependency.
Officer UI looks generic	Medium	Custom dark theme. Glassmorphism. Lucide icons. No Material Design defaults.
Mobile responsiveness broken	Medium	Mobile-first Tailwind. Test at 375px. Bottom-nav for MSME flow.

11. Future Roadmap (Post-Hackathon)

- Month 1-2: Pilot with IDBI Chennai SME branch. 50 real MSME profiles. Validate score accuracy against actual loan outcomes.
- Month 3-4: Integrate real GST APIs (NIC), AA frameworks (Finvu, OneMoney), and UPI data (NPCI sandbox).
- Month 5-6: Add predictive default module (Track 04 synergy). Train ML model on pilot outcomes. Move from rule-based to hybrid ML.
- Month 7-9: OCEN/ULI production integration. Enable sachet-sized loans (<₹2L) with fully automated disbursal.
- Month 10-12: Multi-lender SaaS. White-label for NBFCs. API marketplace for score-as-a-service.

Appendix A: Color Tokens

Token	Light Mode	Dark Mode	Usage
bg	#f7f6f2	#171614	Page background
surface	#f9f8f5	#1c1b19	Card backgrounds
surface-2	#fbfbf9	#201f1d	Elevated cards
text	#28251d	#cdcca	Primary text
text-muted	#7a7974	#797876	Secondary text
primary	#01696f	#4f98a3	CTAs, active states
success	#437a22	#6daa45	Approved, positive signals
warning	#964219	#bb653b	Medium risk, pending
error	#a12c7b	#d163a7	Rejected, high risk

Appendix B: Mock MSME Profiles

ID	Name	Type	Score	Grade	Risk	Status	Loan Type
APP-001	Sri Lakshmi Engineering	Manufacturing	718	B+	Low-Med	Pending	Working Capital
APP-002	Ramesh Textiles	Trading	572	C+	High	Pending	Invoice Financing
APP-003	Bharat Digital Solutions	Services	802	A	Low	Approved	Machinery Loan
APP-004	Annapurna Food Products	Manufacturing	575	C+	High	Pending	Working Capital

APP-005	Venkateswara Auto Parts	Manufacturing	708	B+	Low-Med	Pending	Equipment Purchase
APP-006	Green Earth Packaging	Manufacturing	750	A-	Low	Approved	Working Capital

Appendix C: Judging Criteria Mapping

IDBI Criterion	FinHealth Evidence	Screen Location
Alternate data aggregation	4-agent parallel sync with source labels	MSME Step 3
Multidimensional score	300-900 composite + 4 dimension sub-scores	Health Card
Visualize strengths/risks	Radar chart + signal tags + risk band badge	Health Card
ULI/OCEN/AA integration	API hooks + OCEN-compatible loan payload	Loan Apply + Backend
Near real-time	Parallel execution <4min end-to-end	MSME Step 3
Expand credit-invisible	6 profiles with thin-file approvals	Officer Queue
Innovation & creativity	Agentic architecture + explainability by design	Explainability Panel
Technical feasibility	Production stack, deployable today	Architecture section
Business impact	Portfolio monitoring + stress rate tracking	Monitoring Dashboard
