

FinHealth PPT Content Guide

Slide-by-slide content and visual design plan for the IDBI Innovate prototype submission deck

Deck understanding

The uploaded prototype submission deck expects slides for team details, brief idea, opportunities, features, process flow, wireframes, architecture, technologies, estimated cost, prototype snapshots, performance/benchmarking, future development, and links [file:56].

To maximize scoring, each slide should feel visual-first: one core message, minimal text, and one strong diagram, UI snapshot, flow, or metric block instead of dense paragraphs [file:56].

Slide 1 — Team Details

Exact content: Title: FinHealth — MSME Financial Health Card. Include team name, team leader, problem statement: Track 03 — AI/ML-driven Financial Health Card for MSMEs using GST, UPI, AA, and EPFO data. Add one-line pitch: "From credit-invisible to credit-worthy in minutes."

Design: Use a dark premium cover. Left side: title + team details. Right side: large hero visual of the Health Card screen mockup. Add 4 small chips: GST, UPI, AA, EPFO.

Slide 2 — Brief about the idea

Exact content: Use 3 crisp blocks: Problem — MSMEs lack formal credit history. Solution — FinHealth builds an explainable health score from alternate data. Outcome — faster, fairer lending and proactive monitoring.

Design: Use a 3-column card layout with icons: Problem / Solution / Outcome. Put a mini radar chart or score card preview at bottom right.

Slide 3 — Opportunities

Exact content: Answer all three prompts directly: (1) How different? Explainable, agentic, multi-source, built for Indian lending rails. (2) How solve problem? Converts GST/UPI/AA/EPFO into a unified credit view. (3) USP? Dual-sided platform for both MSME and credit officer, plus post-loan monitoring.

Design: Use a comparison table: Traditional underwriting vs FinHealth. 4 rows only: data used, speed, explainability, post-loan visibility. Add one highlight box: "Not just scoring — underwriting + monitoring."

Slide 4 — Features offered

Exact content: List 6 features only: Granular consent onboarding; 4-agent data sync; Financial Health Card; explainability engine; officer decision console; portfolio monitoring/watchlist.

Design: Use a 2x3 feature grid with icon + 1 short line each. Keep it very visual; no paragraphs.

Slide 5 — Process flow / Use-case

Exact content: Flow: MSME enters GSTIN -> gives consent -> 4 agents fetch data -> orchestrator computes score -> health card generated -> loan application submitted -> officer reviews explainability -> decision logged -> monitoring begins.

Design: Use a horizontal flow diagram with arrows and 8 nodes. Color-code MSME-side steps in teal and bank-side steps in amber.

Slide 6 — Wireframes / Mock diagrams

Exact content: Show 3 screens only: MSME onboarding consent screen, Financial Health Card screen, Officer decision screen. Add tiny labels under each: Input, Insight, Action.

Design: Use device/browser mock frames. Keep a lot of whitespace. Use short captions instead of bullets.

Slide 7 — Architecture diagram

Exact content: Present 4 layers: Frontend (MSME app + officer console), API layer, agent orchestration layer (GST/UPI/AA/EPFO agents), data layer. Mention simulated integrations for prototype.

Design: Use a layered architecture diagram with boxes and arrows. Make the scoring orchestrator the visual center. Avoid too much text inside boxes.

Slide 8 — Technologies used

Exact content: Frontend: Next.js/React, Tailwind, TypeScript. Backend: FastAPI/Python. Data: Supabase/Postgres. AI/logic: scoring engine + LLM explanations. Charts/UI: SVG/Recharts/Lucide. Deploy: Vercel.

Design: Use a stack pyramid or grouped technology cards by layer. Add tiny logos if available. Keep no more than 5 groups.

Slide 9 — Estimated implementation cost

Exact content: Since optional, keep it simple and realistic: Prototype cost near-zero using free tiers. Pilot cost buckets: cloud hosting, API integrations, compliance/security, dashboard ops. Mention "Hackathon MVP built on free/open developer stack."

Design: Use two columns: MVP Prototype vs Pilot Deployment. Add a small donut or stacked bars instead of too many numbers.

Slide 10 — Snapshots of prototype

Exact content: Show the best 4 snapshots: landing/role selection, health card, officer queue, explainability/monitoring. Add 1-line caption under each describing value.

Design: Make this almost entirely visual. Use a clean 2x2 screenshot gallery with subtle shadows and labels.

Slide 11 — Prototype performance / Benchmarking

Exact content: Use 4 metrics: 4 data agents orchestrated; near real-time score generation; explainable feature contributions for every decision; portfolio watchlist for early warning. If you have measured timings, show them. If not, show system capability benchmarks, not fake accuracy claims.

Design: Use KPI tiles + one small benchmark chart. Do not claim unrealistic ML accuracy. Emphasize functional readiness and decision transparency.

Slide 12 — Additional details / Future development

Exact content: Use roadmap bullets: real AA/GST integrations, OCEN/ULI production hooks, richer alternate data, ML-based risk calibration, multi-bank SaaS expansion.

Design: Use a simple roadmap timeline with 4 phases: MVP, Pilot, Production, Platform.

Slide 13 — Links

Exact content: Provide GitHub repo, 3-minute demo video, and product link. Add QR codes if possible. Ensure links are short and readable.

Design: Use a clean closing slide with 3 big cards: GitHub, Demo Video, Product. Add QR on right side and one closing tagline at bottom.

Design system for the whole deck

Use a premium dark theme to match a bank-grade AI product: deep navy background, teal primary accent, amber secondary accent, white headings, muted slate body text. This will visually align the deck with the product UI and make screenshots feel integrated rather than pasted [file:56].

Recommended palette: #020617 background, #0f172a surface, #14b8a6 primary, #f59e0b secondary, #e2e8f0 text, #94a3b8 muted text. Use one geometric sans font such as Inter or Manrope for body and Space Grotesk/Sora for titles.

Use these recurring elements on every slide: top-left slide title, one visual anchor, one highlight chip, and a small footer with team name + Track 03. Avoid crowded paragraphs, long sentences, and more than 3 colors on any slide.

How to actually make the PPT fast

- First build the app screens and capture 4 high-quality screenshots before editing slides.
- Second create 2 reusable master slide layouts: one for content + visual, one for full-visual slides.
- Third create all diagrams in Figma, Excalidraw, or PowerPoint shapes using the same color system.
- Fourth keep each slide to one message: explain, compare, flow, prove, or show.
- Fifth end by checking narrative sequence: problem -> solution -> differentiation -> product -> architecture -> proof -> future.
